January 3, 2022

All data, projections and opinions are as of the date of this report and subject to change.

IN THIS ISSUE

Macro Strategy—A New Dawn for Nominal Growth. The most powerful monetary and fiscal stimulus since World War II (WWII) has pushed inflation, as measured by the Consumer Price Index (CPI), to 9% at an annualized rate over the September-November period. That has far exceeded consensus expectations and boosted U.S. nominal gross domestic product (GDP) growth to the strongest levels in four decades.

Leading indicators of economic growth point to a strong first half for 2022, and with the Federal Reserve (Fed) itself projecting sustained massive accommodation for the foreseeable future, in our opinion, inflation, nominal GDP, corporate revenues and profits are likely to continue to surprise to the upside.

Market View—Three Hikes Isn't the Same as Three Strikes. High-single-digit total returns for the S&P 500 is our base case for 2022, or reversion to mean. Even in the face of a new tightening cycle, and the majority of Fed officials expecting three rate increases in 2022, three hikes is not the same as three strikes.

As we have stressed repeatedly, average S&P 500 returns are typically solid one year out from the initial interest rate hike because economic growth and corporate profits are robust, offsetting the nascent shift in monetary policy. Also, the latter works with a one-year lag, so the compounding effects of tighter monetary policies will likely be more of a headwind for the markets and economy later in 2022 and into 2023.

Thought of the Week—2022 The Return to Normal With Normal Returns? Buoyed by a strengthening economy, accommodative monetary policy and strong corporate earnings, major U.S. indexes yet again notched double-digit gains for 2021.

While equity markets are no stranger to mid-cycle lulls like in 2015 and 2018, it's worth noting that, according to Bloomberg, the past nine times the S&P 500 was up over 20% in a year, the index was higher that next year every single time. The above-average 2021 returns add to a recent string of exceptional Equity market performance, making "average" all the more relative.

Data as of 1/3/2022,
and subject to change

Portfolio Considerations

We expect a grind-it-out market environment in which valuations could remain flat or slightly decline but with profit growth to supersede this and Equity outperformance to continue. Within Fixed Income, we favor credit overall especially Investment-grade, and also prefer municipals relative to Treasuries. We continue to maintain a shorter duration stance. Qualified investors could also consider opportunities in Alternative Investments, which could add another layer of diversification to a portfolio.

A New Dawn for Nominal Growth

Robert T. McGee, Managing Director and Head of CIO Macro Strategy

Irene L. Peters, CFA®, Director and Senior Macro Strategy Analyst

After two decades of sub-4% nominal GDP growth, inflation below 2%, and fears of endless stagnation, the U.S. economy took off in 2021. The reason is simple. As shown in Exhibit 1, after the inflationary money growth of the 1960s and 1970s, then Fed Chair Paul Volcker reined in money growth, and it grew well below its historical average for three decades until the pandemic. As a result, inflation fell, reaching just-below 2% during the “secular stagnation” era between 2009 and 2019. Since 1900, including the sub-2% pre-pandemic decade, CPI averaged just over 3%. Sub-normal inflation kept risk aversion hovering over financial markets worried about the growing debt burden in the economy. The big debt burden and the slowest nominal growth since the 1930s kept downward pressure on interest rates and put a premium on Growth over Value that lasted longer and was among the biggest in history. As that era ends, the Growth-stock premium has begun to recede.

Exhibit 1: Inflation Tends To Respond To Changes In Money Supply With A Lag Of Two to Three Years.

*Last data point shows the past six-month annualized rate for 2021. **Standard deviation is a measure that is used to quantify the amount of variation or dispersion of a set of data values. M2=a measure of money supply used by the various central banks. Z-score is a numerical measurement that describes a value's relationship to the mean of a group of values. Sources: Bureau of Labor Statistics; Fed Board/Haver Analytics. Data as of December 28, 2021.

As shown in Exhibit 1, the biggest monetary surge since WWII has broken the back of secular stagnation. The world economy has gone from chronic excess supply to chronic excess demand in less than a year. The supply shortages still baffling analysts are simply the result of too much demand relative to the capacity of current supply chains. Most of the baffled were not around in the 1970s when similar excess demand caused chronic shortages and sent inflation to record highs. Indeed, these excess demand and chronic supply shortages occurred during a similar period of sustained excess money-supply growth that funded massive federal government expansion during the Vietnam and Great Society eras much as the pandemic-motivated government expansion has fueled the biggest fiscal deficits since WWII. As in WWII, the Fed has monetized these record deficits, igniting inflation. For the markets, the main implication of this new era is that nominal growth will likely settle back into a more normal historical range of 6% to 7% after the unusually low nominal growth (3% to 4%), inflation and interest rates of the pre-pandemic secular stagnation era.

The dawn of this new era has caught the Fed and consensus economists by surprise. According to the consensus forecast in the Blue Chip Economic Indicators for January

Portfolio Considerations

As the Fed dials back this stimulus in 2022, investors may start to turn to more defensive areas of the market that lagged in 2021, such as Consumer Staples, Healthcare and Utilities. At the same time, the cyclical areas of the market that benefit from high inflation and strong growth should continue to do well as long as monetary policy remains accommodative, as the Fed currently projects. While helping financial stocks, higher interest rates have pulled the rug out from under the long-duration Growth stocks, which entered a severe bear market in 2021. We expect this Growth-to-Value rotation to continue in a world of excess demand.

2021, consumer prices were forecast to rise just 2% in 2021. The Fed maintained that the higher inflation that was actually observed in 2021 was “transitory” even as it averaged above 7% by year end, marking the biggest forecast error by economists in at least 40 years. A simple look at Exhibit 1 a year ago would have suggested the high-single-digit inflation surge that actually occurred.

It’s not just inflation forecasts that were wide of the mark. Economists also underestimated real GDP growth, nominal GDP growth, industrial production, personal income, consumer spending, business fixed investment and, particularly, corporate profits. For example, in January 2021, they forecast that profits would grow 8.1% in 2021. By December, with three quarters of huge positive surprises, profits growth was tagged just above 23%. These enormous profits surprises have driven the powerful Equity bull market in 2021.

These huge misses are the result of the unprecedented stimulus and its underestimated effect on nominal GDP, which is what governs business and consumer incomes, sales and investment, profits and production. Over the course of 2021, the consensus forecast for nominal GDP growth rose from 6% to almost 10%. Ever since the first Coronavirus Aid, Relief, and Economic Security Act (CARES Act) was passed in March 2020, economists have failed to properly gauge the effect of policy stimulus on the economy, focusing instead on the downside risks from coronavirus. However, the first CARES Act already plugged the economic hole from the shutdowns, causing incomes to rise for the first time ever in a recession that was also the shortest in history.

Concerns that the Fed is about to take the punch bowl away from the party have caused some typical late-cycle risk aversion to creep into recent Equity market positioning. Relative performance has started to improve in sectors like Consumer Staples, Healthcare and Utilities, which tend to outperform as expansions wind down. Nevertheless, inflation beneficiaries such as energy, materials and financial stocks continue to perform well despite their long mid-year consolidations while the market priced in 2022 rate hikes.

We expect this cyclical outperformance to continue since the Fed remains highly accommodative according to its own projections. One of the best leading indicators of the business cycle is the yield-curve spread between the fed funds rate and the 10-year Treasury note. That spread widened significantly in 2021 as the Fed funds rate stayed near zero and the 10-year yield rose about 50 basis points. A steeper yield curve is a sign that policy is getting easier, not tighter. Also showing that policy remains highly accommodative despite faster tapering and rate-hike expectations, real rates remain deeply negative across all Treasury maturities. Credit spreads also remain unusually narrow by historical standards, consistent with healthy profits and relatively easy financial conditions. Eventually, over the course of 2022, these indicators will reflect tightening financial conditions and weaker economic growth but not until the Fed gets ahead of the curve.

However, the pandemic caused the Fed to shift from a preemptive policy of “skating toward where it expected the inflation puck to be in the future” to a reactive policy of waiting until it saw the whites of inflation’s eyes. Being behind the curve means the Fed is skating toward where the inflation puck was. In the 1970s, a similarly flawed reactive policy caused the Fed to sustain excessive money growth and inflation, much as it did in 2021. Right now, the composite index of leading indicators is up about 10% from a year ago, a very strong signal that the U.S. economy is entering 2022 with a full head of steam even as inflation is way ahead of expectations. This suggests strong incomes, spending, revenues and profits will continue well into 2022.

Three Hikes Isn't the Same as Three Strikes

Joseph P. Quinlan, Managing Director and Head of CIO Market Strategy

Don't fear the Fed—at least not in 2022. While 12 of the 18 members of the Federal Open Market Committee expect at least three rate increases in 2022, investors should not equate three hikes with three strikes and, therefore, the end of the bull market in U.S. Equities. As we have stressed repeatedly, average S&P 500 returns are typically solid one year out from the initial rate hike because economic growth and corporate profits are robust, offsetting the nascent shift in monetary policy. Also, the latter works with a one-year lag, so the compounding effects of tighter monetary policies will be more of a headwind for the markets and economy later in 2022 and into 2023.

As a point of reference, the average total returns of the S&P 500 over 2004 to 2006—with the Fed raising rates 17 times—was 10.5%; over the 2016-18 rate hike cycle, returns were 9.8%.¹

As for timing, equity prices rollover at the end of a Fed tightening cycle, not at the start. That said, the consensus expects the Fed to be raising rates well into 2023 and beyond.

Whether the Fed opts for a rate hike in March or June remains an open question. According to the latest estimates from the Atlanta Federal Reserve, the economy expanded at a 7.6% annualized clip in the final quarter of 2021, following a soggy third quarter (2%). However, owing to the surge in the Omicron variant, Q1 2022 growth prospects have dimmed, notably among service-related activities like in-sitting restaurant visits, air travel, and in-store sales. Omicron—and its macro effects—could be a swing factor in whether the Fed moves sooner rather than later.

A question of when, not if

But with headline inflation at 6.8% in November (YoY) and core personal consumption expenditures up roughly 4.7% in the same period, the Fed, after a three-year hiatus, is poised to begin a new tightening cycle in 2022. The latter is synonymous with market choppiness and volatility as the Fed navigates a balancing act that hinges on moving neither too fast in draining liquidity from the capital markets, nor too slow. The former could ultimately tip the economy into recession; the latter risks inflation becoming even more embedded in the economy, requiring the Fed to be even more aggressive down the road. Outside of earnings expectations, no variable has more sway over market sentiment and relative asset prices than the cost of capital—and hence the importance of the Fed having a deft hand in setting monetary policy for 2022.

Speaking of earnings, the outlook for 2022 remains solid for a number of reasons, with above-trend nominal U.S. GDP growth chief among them. Catalysts for growth this year include not only the lagged effects of ultra-ease monetary policies and fiscal spending (roughly \$6 trillion since 2020) but also strong demand/spending from U.S. households and corporations. Both entities are flush with cash and poised to deploy it in 2022.

According to data from the Fed, U.S. corporations are currently sitting atop some \$7 trillion in cash owing to ultra-low interest rates and debt rescheduling, as well as strong earnings growth. How will this cash hoard be spent? Well, if history is any guide, think more capital expenditures (capex) spending, hiring, dividends and buybacks, and rising levels of mergers and acquisitions.

U.S. households are also flush. Strong employment gains, rising wages, government transfers, and booming stock and real estate markets—all of these factors have converged to push the level of U.S. household net worth to the stratosphere, with household net worth reaching nearly \$145 trillion at the end of Q3 2021. As depicted in

Portfolio Considerations

In terms of portfolio construction, we continue to prefer sectors and industries with pricing power (Energy, Materials, Industrials and Financials) and industries with high free cash flow and operating leverage, i.e., we remain long-term bulls on U.S. large-cap technology but acknowledge the volatility to these industries given the prospects of rising interest rates.

¹ See "Stocks' Rally Will Likely Survive the Fed's First Hike, Crossmark Says," Bloomberg, December 27, 2021.

Exhibit 2, U.S. household net worth, after closely tracking world GDP in the early part of this century, has soared over the past few years and is now nearly 50% larger than the entire output of the planet. The gap reflects many variables, including the depth and sophistication of the U.S. capital markets; the U.S. dollar as the world's reserve currency; U.S. global competitiveness, notably America's world-class technological capabilities; a skilled labor pool; and the U.S.' risk-taking, entrepreneurial culture that helps attract the world's best talent and incubates some of the largest and most dynamic companies in the world. All of the above is what we call American Exceptionalism—and remains, in our opinion, a key support for our long-term bull case for U.S. Equities.

Exhibit 2: American Exceptionalism: U.S. Household Net Worth vs. Global GDP.

Sources: Federal Reserve Bank of St. Louis; International Monetary Fund. Data as of July 7, 2021.

Near term, and powered by robust demand from households and corporations, we think the profit cycle continues to advance and that earnings estimates trend above expectations, at least over the first half of 2022.

Investment Implications

Top themes: automation and robotics; waste water treatment; everything storage (batteries, data centers, solar, wind, etc.) and healthtech—or the fusion of science and technology.

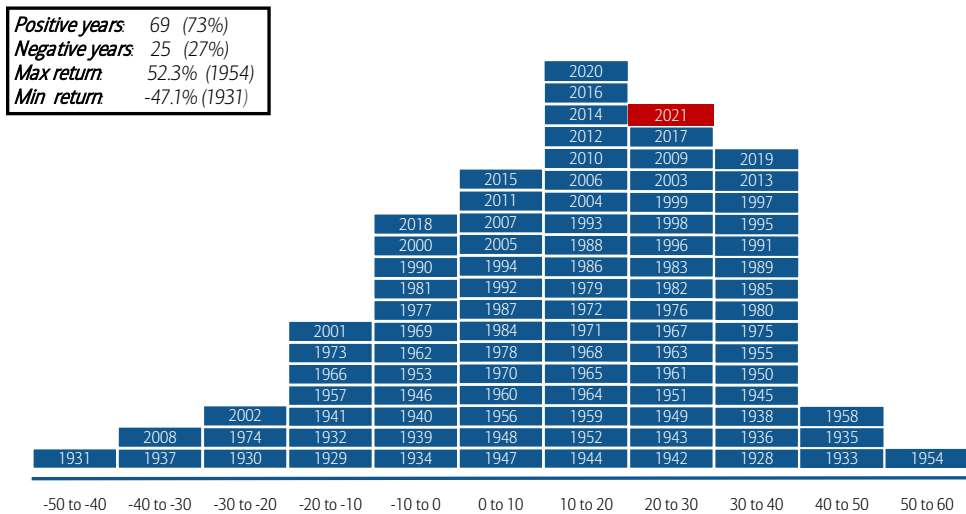

Finally, we would be remiss if we didn't mention some key "known unknowns" for 2022—or specific events or ongoing trends beyond the Fed that could alter our general outlook for the markets. What we are watching: geopolitical tensions between the U.S. and both China and Russia; the regulatory backdrop in Washington, Brussels and Beijing, with tech top of mind; the role/acceptance of cryptocurrencies; the prospects of a Republican sweep in November; supply chain bottlenecks; the explosion in the space economy; the global hunt for talent and the rising power of unions; and of course, the future path of the coronavirus and the risks of more infectious variants. More on those topics in the weeks ahead.

2022 The Return to Normal with Normal Returns?

Lauren J. Sanfilippo, Vice President and Senior Investment Strategist

2021's above-average returns add to a recent string of exceptional Equity market performance, making "average" all the more relative. Buoyed by a strengthening economy, accommodative monetary policy and strong corporate earnings, major U.S. indexes yet again notched double-digit gains for the year (Exhibit 3). The S&P 500 ended 26.9% (28.7% Total Return) higher for 2021, easily topping 10-year average annualized returns of around 10%; and for the first time since 2016, S&P returns outpaced those of the NASDAQ.

Exhibit 3: S&P 500 Total Return: 1928–2021, Annual Percent.

Source: Bloomberg. Data as of 12/31/2021. **Past performance is no guarantee of future results.**

Since inception, the benchmark index has impressively ended in positive territory 73% of the time.² Less the exception, more the rule for 2022, most stocks landed in positive territory for 2021, with 10 of the top performers of the S&P 500 jumping by more than 100%. Only 66 stocks in the index generated negative returns in 2021, including some high-fliers from 2020 that have since retraced (consolidated) gains. For the 2021 year, the index posted 70 fresh record highs, the second most on record.

Beyond the large-cap benchmark, small-cap (Russell 2000) performance trailed with half the return (13.7%) of large-caps. The Dow Jones Industrial Average added over 5,700 points, or 18.7% (21.0% Total Return) in 2021, although behind the tech-heavy Nasdaq Composite gain of 21.4% (22.2% Total Return). Globally, the picture was mostly worse, as the MSCI Emerging Markets Index ended in the red (-5.5%), and MSCI China, in particular, took a -22.5% hit. The MSCI All World excluding the U.S. posted modest gains of 4.8%.

S&P returns over the three-year period of 2019-21 (90%) are the strongest this century. So what's ahead? Party over? Not necessarily. While equity markets are no stranger to mid-cycle lulls like in 2015 and 2018, given the current market backdrop—robust nominal GDP, negative real interest rates, the proven resiliency of Corporate America—we see continue upside for U.S. Equities again in 2022, with an emphasis on high-quality, free cash flows, and dividend growth. Overseas, non-U.S. Equities underperformed U.S. markets for a 10th year in 12 years since 2009.

² As an important footnote, the S&P 500 began as a "composite index" in 1926 and was comprised of 90 stocks. The current index was revamped and broadened in 1956/57 to include 500 companies. Presently, there are 505 stocks in the index since a few companies in the index have multiple share classes.

Investment Implications

Our base case is for a grind-it-out market environment in 2022, with higher equity prices mainly supported by better-than-expected profit growth. Persistent negative real interest rates also favor Equities, notably dividend payers.

Investors should expect more market volatility as the Fed removes the ultra-easy monetary policies of the past few years but be mindful of the fact that given the sweep of history, the S&P 500 remains one of the world's greatest wealth-creating machines ever conceived.

We remain tactically neutral in both International Developed and Emerging Markets but are monitoring key variables carefully (supply chain bottlenecks, currencies, coronavirus cases, etc) for opportunistic entry points in 2022.

Index Definitions

Securities indexes assume reinvestment of all distributions and interest payments. Indexes are unmanaged and do not take into account fees or expenses. It is not possible to invest directly in an index. Indexes are all based in U.S. dollars.

S&P 500 Index is a stock market index that measures the stock performance of 500 large companies listed on stock exchanges in the United States. It is one of the most commonly followed equity indices.

Consumer Price Index is a price index, the price of a weighted average market basket of consumer goods and services purchased by households.

Dow Jones Industrial Average is a price-weighted measurement stock market index of 30 prominent companies listed on stock exchanges in the United States.

NASDAQ/Nasdaq Composite is a stock market index that includes almost all stocks listed on the Nasdaq stock exchange.

MSCI Emerging Markets Index is a selection of stocks that is designed to track the financial performance of key companies in fast-growing nations.

MSCI China Index consist of a range of market capitalization weighted and alternative weighted indexes for the Chinese markets, intended for both domestic and international investors, including Qualified Foreign Institutional Investors (QFII) licensees.

MSCI All World Index excluding the U.S. is a market-capitalization -weighted index designed to provide a broad measure of stock performance throughout the world, with the exception of U.S.-based companies.

Russell 2000 Index refers to a stock market index that measures the performance of the 2,000 smaller companies included in the Russell 3000 Index.

Important Disclosures

Investing involves risk, including the possible loss of principal. Past performance is no guarantee of future results.

Bank of America, Merrill, their affiliates and advisors do not provide legal, tax or accounting advice. Clients should consult their legal and/or tax advisors before making any financial decisions.

The Chief Investment Office ("CIO") provides thought leadership on wealth management, investment strategy and global markets; portfolio management solutions; due diligence; and solutions oversight and data analytics. CIO viewpoints are developed for Bank of America Private Bank, a division of Bank of America, N.A., ("Bank of America") and Merrill Lynch, Pierce, Fenner & Smith Incorporated ("MLPF&S" or "Merrill"), a registered broker-dealer, registered investment adviser and a wholly owned subsidiary of Bank of America Corporation ("BofA Corp."). This information should not be construed as investment advice and is subject to change. It is provided for informational purposes only and is not intended to be either a specific offer by Bank of America, Merrill or any affiliate to sell or provide, or a specific invitation for a consumer to apply for, any particular retail financial product or service that may be available.

The Global Wealth & Investment Management Investment Strategy Committee ("GWIM ISC") is responsible for developing and coordinating recommendations for short-term and long-term investment strategy and market views encompassing markets, economic indicators, asset classes and other market-related projections affecting GWIM.

All recommendations must be considered in the context of an individual investor's goals, time horizon, liquidity needs and risk tolerance. Not all recommendations will be in the best interest of all investors.

Asset allocation, diversification, dollar cost averaging and rebalancing do not ensure a profit or protect against loss in declining markets.

Dividend payments are not guaranteed, and are paid only when declared by an issuer's board of directors. The amount of a dividend payment, if any, can vary over time.

Investments have varying degrees of risk. Some of the risks involved with equity securities include the possibility that the value of the stocks may fluctuate in response to events specific to the companies or markets, as well as economic, political or social events in the U.S. or abroad. Investing in fixed-income securities may involve certain risks, including the credit quality of individual issuers, possible prepayments, market or economic developments and yields and share price fluctuations due to changes in interest rates. Bonds are subject to interest rate, inflation and credit risks. Treasury bills are less volatile than longer-term fixed income securities and are guaranteed as to timely payment of principal and interest by the U.S. government. Investments in foreign securities involve special risks, including foreign currency risk and the possibility of substantial volatility due to adverse political, economic or other developments. These risks are magnified for investments made in emerging markets. Investments in a certain industry or sector may pose additional risk due to lack of diversification and sector concentration.

Cryptocurrency markets are highly volatile and risky, and may not be appropriate for most investors looking to meet long-term savings or retirement goals. Cryptocurrency and many crypto-related investments are subject to minimal regulatory oversight, and there may be no recourse should the cryptocurrency disappear due to a cybersecurity breach or hack. Cryptocurrency investors rely upon unregulated exchanges that may lack appropriate internal controls, making them susceptible to fraud, theft and hacking. Direct holding of cryptocurrency only exist on the Internet. Issuers can be located anywhere in the world, so it may be impossible to trace and recover lost funds through the courts. Cryptocurrency accounts are not insured by U.S. depository insurance. Creating a digital wallet to store cryptocurrency involves installing software on an investor's computer. As with any software download, hackers may include malicious code, creating unwanted files or programs that can cause harm to a computer or compromise data stored on a computer. Purchasers of cryptocurrencies rely on the strength of their own computer systems as well as systems provided by third parties to protect purchased cryptocurrencies from theft.

Alternative Investments are speculative and involve a high degree of risk.

Alternative investments are intended for qualified investors only. Alternative Investments such as derivatives, hedge funds, private equity funds, and funds of funds can result in higher return potential but also higher loss potential. Changes in economic conditions or other circumstances may adversely affect your investments. Before you invest in alternative investments, you should consider your overall financial situation, how much money you have to invest, your need for liquidity and your tolerance for risk.
